Sir:

**PATENT APPLICATION TRANSMITTAL LETTER**

Transmitted herewith for filing, please find the following:

- X Specification, claims and abstract of the above-referenced patent application (total of 15 pages)
- X 3 sheet(s) of drawing(s) (X formal/    informal).
- X Combined Declaration and Power of Attorney (signed).
- X An Assignment of the invention to: WMS Gaming Inc.
- A verified statement claiming small entity status under 37 CFR 1.9 and 1.27.
- X Other (specify): Information Disclosure Statement; Form PTO-1449; Acknowledgment postcard.
- This application is a:

- Continuation
- Divisional
- Continuation-In-Part

of prior copending parent application Serial No. filed on now pending.

Please amend the application to insert the following line in the beginning of the specification:

--This application is a Continuation of prior application Serial No. filed on  
, now pending.--

In the event that a petition to extend time under 37 CFR 1.136 is necessary in the parent application to maintain copendency for this application, a petition for an extension of the necessary time to maintain copendency is hereby requested for the parent application and the Commissioner is hereby authorized to debit our Account Number 10-0447 for the necessary fees.

The filing fee has been calculated as shown below:

	NO. FILED	NO. EXTRA	RATE	FEE
BASIC FEE				\$690
TOTAL CLAIMS	13-20	0	\$18	0
INDEPENDENT CLAIMS	3- 3	0	\$78	0
MULTIPLE DEPENDENT CLAIM(S) PRESENTED			\$260	
TOTAL FEES: _____				\$690
Deduct one-half of fee for Small Entity				=
ASSIGNMENT RECORDAL FEE			\$40	
TOTAL AMOUNT DUE:				\$730

— Please charge my Deposit Account No. 10-0447 in the amount of \$

X Check(s) in the amount of \$ 730.00 is/are attached. Please charge any deficiency or credit any overpayment to Deposit Account No. 10-0447 .

X The Commissioner is hereby authorized to charge payment of the following fees during the pendency of this application or credit any overpayment to Deposit Account No. 10-0447.

X Any patent application processing fees under 37 CFR 1.17 and under 37 CFR 1.20(d).

— The issue fee set in 37 CFR 1.18 at or before mailing of the Notice of Allowance, pursuant to 37 CFR 1.311(b).

X Any filing fees under 37 CFR 1.16 including fees for presentation of extra claims.

## FIELD OF THE INVENTION

The present invention relates generally to reel mechanisms for slot machines and, more particularly, to a reel mechanism having a dedicated local microcontroller for handling low-level reel driver operations associated with a reel of the reel mechanism.

## BACKGROUND OF THE INVENTION

Conventional slot machines include a plurality of symbol-bearing reels that are rotated and stopped to place the symbols of each reel in visual association with one or more pay lines. Although some of these machines now simulate the reels using images on a video screen, many slot machines still employ mechanical reels. Each mechanical reel is mounted to the rotatable shaft of a stepper motor under the control of a central processing unit (CPU). The CPU includes reel driver software that monitors the reel and controls its positioning. This requires the CPU to sample the state of each reel in real time. The CPU must read the status of each reel hundreds of times per second, perform calculations, and respond with control commands. Because the CPU must perform a variety of other tasks, its overall performance is diminished by having to perform low-level reel driver operations in addition to these other tasks.

## SUMMARY OF THE INVENTION

To overcome this drawback, the present invention provides a reel driver having a dedicated local microcontroller that assumes the low-level reel driver operations previously performed by the CPU. Because the local microcontroller performs the low-level reel driver operations, the CPU is free to provide better performance for other tasks.

In one embodiment, a slot machine comprises a CPU and a reel mechanism. The CPU operates the slot machine in response to a wager. The reel mechanism includes a motor, a symbol-bearing reel, and a reel driver. The motor includes a rotatable shaft, and the reel is mounted to the shaft. The reel driver includes a local microcontroller distinct from and coupled to the CPU. The reel driver is coupled to the motor to cause the motor to rotate the reel.

The CPU issues high-level commands to the reel driver related to rotation of the reel. The high-level commands may, for example, include a start spin command

1 for starting rotation of the reel and a stop command for stopping the reel at a specified  
2 position. However, to free up the CPU for other tasks, the local microcontroller  
3 performs low-level reel driver operations related to the rotation of the reel. The low-  
4 level reel driver operations may, for example, include sampling a state of the reel in  
5 real time, performing calculations, and responding with control changes.

## 6 7 **BRIEF DESCRIPTION OF THE DRAWINGS**

8 The foregoing and other advantages of the invention will become apparent  
9 upon reading the following detailed description and upon reference to the drawings in  
10 which:

11 FIG. 1 is an isometric view of a slot machine embodying the present invention  
12 with portions broken away to reveal internal structure;

13 FIG. 2 is an isometric view of a reel mechanism of the slot machine; and

14 FIG. 3 is a block diagram of a CPU and the reel mechanism of the slot  
15 machine.

16 While the invention is susceptible to various modifications and alternative  
17 forms, specific embodiments have been shown by way of example in the drawings  
18 and will be described in detail herein. However, it should be understood that the  
19 invention is not intended to be limited to the particular forms disclosed. Rather, the  
20 invention is to cover all modifications, equivalents, and alternatives falling within the  
21 spirit and scope of the invention as defined by the appended claims.

## 22 23 **DESCRIPTION OF ILLUSTRATIVE EMBODIMENTS**

24 Turning now to the drawings, FIG. 1 depicts a slot machine 10 embodying the  
25 present invention. The slot machine 10 includes a cabinet 20 housing a plurality of  
26 symbol-bearing mechanical reels 12, 14, and 16 that are rotated and stopped to place  
27 the symbols of each reel in visual association with at least one pay line 18. Each pay  
28 line 18 preferably extends through at least one symbol on each of the reels. Each of  
29 the reels includes a number of discrete stop positions (e.g., eighteen) each of which  
30 corresponds to a respective symbol. The slot machine 10 may incorporate any  
31 number of reels, and each of the reels can include any reasonable number of stop  
32 positions. Any system of symbols can be utilized as long as there is one symbol,

which may include a “blank” symbol, corresponding to each stop position on each reel.

To initiate game play, a player makes a wager by inserting coins into a coin slot 20, bills into a bill acceptor 22, or playing a number of credits. If the machine includes more than one pay line 18, the machine may automatically activate a number of pay lines corresponding to the number of coins or credits played. In addition, the machine may include keys on button panel 24 that allow the player to select the number of pay lines 18 to play and to select the number of coins or credits to bet on the selected pay lines.

In response to the wager, a “start” key and/or handle 26 is enabled. By pushing the “start” key or pulling the handle 26, the player causes a CPU housed within the slot machine’s cabinet 28 to set the reels 12, 14, and 16 in motion. The CPU uses a random number generator to select a game outcome corresponding to a particular set of reel stop positions. The mechanical reels are then stopped at the selected set of stop positions. The symbols graphically illustrate the reel stop positions and indicate whether the stop positions of the reels represent a winning game outcome. Winning game outcomes (e.g., symbol combinations resulting in payment of coins or credits) are identifiable to the player by a pay table affixed to the machine 10. A winning game outcome occurs when the symbols appearing on the reels along an active pay line correspond to one of the winning combinations on the pay table. If the displayed symbols stop in a winning combination, the CPU credits the player an amount corresponding to the award in the pay table for that combination multiplied by the amount of credits bet on the winning pay line. The player may collect the amount of accumulated credits in a coin tray 30 by pressing a “Collect” key on button panel 24.

An example of a pay table for the slot machine is shown below:

WINNING COMBINATION			PAYOFF
7	7	7	200
3Bar	3Bar	3Bar	100
2Bar	2Bar	2Bar	40
1Bar	1Bar	1Bar	10
Any Bar	Any Bar	Any Bar	5
Blank	Blank	Blank	2

1 The pay table enables the player to view the winning combinations and their  
2 associated payoff amounts. From the pay table it can be seen that three of the same  
3 symbol along an active pay line generates a payoff for the following symbols: 7,  
4 3Bar, 2Bar, 1Bar, and Blank. Also, a mixed combination of the Bar symbols  
5 generates a payoff. The game may, of course, be modified to vary the payoffs  
6 associated with the winning combinations and to include winning combinations that  
7 do not span all of the reels and/or have other symbols such as fruit symbols, theme-  
8 based symbols, and wild symbols.

9 The reels 12, 14, and 16 are associated with respective reel mechanisms.  
10 Because the three reel mechanisms are the same, only the reel mechanism including  
11 reel 12 is depicted in FIG. 2. The reel mechanism is mounted within the cabinet of  
12 the slot machine and includes a stepper motor 36, the symbol-bearing reel 12, and a  
13 reel driver 38. The reel 12 is mounted to a rotatable shaft 40 of the motor 36. The  
14 reel driver 38 includes a printed circuit board 39 proximate the reel 12 and is coupled  
15 to motor to cause the motor shaft 40 to rotate the reel 12.

16 The reel 12 includes an exterior cylinder 42 and an interior encoder wheel 44.  
17 A symbol-bearing strip is wrapped around and affixed to the exterior cylinder 42.  
18 The encoder wheel 44 preferably is a multi-tab notched disc mounted to either the  
19 motor shaft 40 or to the exterior cylinder 42. The center of the disc corresponds to an  
20 axis of rotation of the reel 12 and the motor shaft 40. The notched disc includes a  
21 plurality of equally spaced, identically shaped tabs (and subsequent notches) disposed  
22 along the disc's circumference. The tabs break an optical detector 48 of the reel  
23 driver 38 many times per revolution of the reel. One of the tabs that form the notches  
24 is uniquely patterned to define a single home position designated in FIG. 2 by the  
25 reference numeral 46. The remaining tabs are used to define the total number of  
26 symbol stops on the reel, as well as to detect reel motion caused by tampering or an  
27 error. As illustrated, the so-called "tabs" and "notches" may be defined by alternating  
28 opaque regions (tabs) and transparent regions (notches) of a cylindrical plastic  
29 member mounted to either the motor shaft 40 or to the exterior cylinder 42.

30 In an alternative embodiment, the encoder wheel 44 is single-tab disc mounted  
31 to either the motor shaft 40 or to the exterior cylinder 42. The disc contains a single  
32 tab that breaks the optical detector 48 of the reel driver 38 once per revolution of the

1 reel. The leading edge of this tab defines the reel's home position and is used as a  
2 reference point (zero point) for determining where to stop the reel 12.

3 Referring to FIG. 3, in accordance with the present invention, the reel driver  
4 38 includes a dedicated local microcontroller 50, a serial interface 52, a motor driver  
5 54, a detector interface 56, the optical detector 48 (see FIG. 2), and a power supply  
6 58. These components are mounted to the printed circuit board 39 shown in FIG. 2.  
7 The local microcontroller 50 is distinct from a main control unit or CPU 60 of the slot  
8 machine but is coupled thereto by a bi-directional serial link 62. The serial link 62  
9 comprises a single cable, and examples of suitable serial links are a Universal Serial  
10 Bus (USB), Firewire, RS-232, RS-485 or Ethernet link. The serial link 62 is  
11 connected to the serial interface 52 which, in turn, is connected to the local  
12 microcontroller 50. To control rotation of the reel, the local microcontroller 50 is  
13 coupled to the stepper motor 36 by the motor driver 54. The motor driver 54 is  
14 powered by the local power supply 58, which receives power from the slot machine's  
15 main power supply. To monitor rotation of the reel, the local microcontroller 50 is  
16 coupled to the optical detector 48 by the detector interface 56.

17 While the CPU 60 of the slot machine performs high-level tasks related to  
18 operation of the slot machine and rotation of the reel 12, the local microcontroller 50  
19 performs low-level reel driver operations related to rotation of the reel 12. The  
20 respective tasks performed by the CPU 60 and the local microcontroller 50 are  
21 described in detail below.

22 With respect to power-up initialization, the local microcontroller 50 initializes  
23 and energizes the stepper motor at power up and resets all necessary reel driver data.  
24 The local microcontroller 50 then enters an "idle" state. Although idle, the local  
25 microcontroller 50 is able to report a status state to any querying devices, e.g., the  
26 CPU 60, and to accept commands from any commanding devices, e.g., the CPU 60.

27 After power has been applied and the CPU 60 has executed various  
28 verification processes to ensure that the slot machine is in working order, the local  
29 microcontroller 50 is configured to the game's specific needs. For example, the  
30 configuration data may include whether the slot machine is a "slant top" or "upright,"  
31 the number of symbols on the reel, the number of steps in the motor, and how to drive  
32 the motor. The CPU 60 sends the configuration data to the local microcontroller 50

1 which, in turn, accepts and processes this data and reports the status of the  
2 configuration back to the CPU 60.

3 Next, the CPU 60 commands the local microcontroller 50 to determine the  
4 type of reel mechanism installed in the slot machine. As described above, the reel  
5 mechanism may include a multi-tab encoder wheel or a single-tab encoder wheel. To  
6 make this determination, the local microcontroller 50 causes the motor to spin the reel  
7 and, via the detector interface 56, counts the number of tabs that break the optical  
8 detector 48. If the encoder wheel includes multiple tabs, as opposed to a single tab,  
9 the local microcontroller 50 compares the total number of detected tabs to the number  
10 of reel symbols set in the configuration data. Although the number of tabs of a multi-  
11 tab encoder wheel does not exactly equal the number of reel symbols, if the number of  
12 detected tabs does not equal the required number of tabs for the reel symbols then the  
13 local microcontroller 50 reports an error to the CPU 60. In case of an error, the CPU  
14 60 halts initialization of the slot machine. If the reel mechanism is valid for the  
15 game's reel symbols, the local microcontroller 50 keeps track of the type of reel  
16 mechanism for later use.

17 With respect to game play, in response to a wager and a player pressing a key  
18 or pulling a handle to set the reels in motion, the CPU 60 issues a high-level  
19 command to the local microcontroller 50 to start spinning the reel. The start spin  
20 command informs the local microcontroller 50 about what direction to spin, a final  
21 constant spin speed, and an acceleration profile (how to begin spinning). The local  
22 microcontroller 50 then places the motor in a "high current" state for motor  
23 acceleration, and then enters a low-level iterative task having a cycle duration of  
24 about 1 millisecond.

25 The low-level iterative task involves such reel driver operations as monitoring  
26 the reel and at least partially controlling its position. While spinning, the local  
27 microcontroller 50 monitors the optical detector 48 via the detector interface 56 to  
28 ensure that the motor is properly rotating the reel. If an error is detected (either no  
29 optical breaks or too many optical breaks), the local microcontroller 50 reports the  
30 error to the CPU 60 which, in turn, halts the game.

31 After a predetermined amount of time, the CPU 60 issues a stop command to  
32 the local microcontroller 50 for stopping the reel at a specified stop position using a  
33 deceleration profile (how to stop spinning the reel). After being commanded to stop

1 spinning the reel, the local microcontroller 50 monitors the optical detector 48 via the  
2 detector interface 56, looking for the home position. If the home position is not  
3 found, the local microcontroller 50 reports an error to the CPU 60 which, in turn, halts  
4 the game. If the home position is found, the local microcontroller 50 decelerates the  
5 reel when necessary and eventually stops the reel at the stop position specified in the  
6 stop command from the CPU 60.

7 If the encoder wheel is of the multi-tab type, during the deceleration process  
8 the local microcontroller 50 monitors the optical detector 48 via the detector interface  
9 56 to verify that the tab-notch-tab sequence is correct. If the local microcontroller 50  
10 finds an inconsistency while decelerating the reel, the local microcontroller 50 reports  
11 an error to the CPU 60 which, in turn, halts the game. If the reel decelerates  
12 correctly, then the local microcontroller 50 monitors the optical detector 48 via the  
13 detector interface 56 after the reel comes to rest. The game is designed so that the  
14 reel should always stop with a notch (gap) of the encoder wheel inside the optical  
15 detector 48. That is, an optical path between the optical detector's transmitter and  
16 receiver should not be blocked. Due to the alternating tab-and-notch configuration of  
17 the multi-tab encoder wheel, if the local microcontroller 50 detects that the optical  
18 detector 48 has been broken by a tab after the reel comes to rest, the local  
19 microcontroller 50 reports an error to the CPU 60 which, in turn, halts the game.

20 In response to detecting an error, the local microcontroller 50 reports the error  
21 to the CPU 60. The CPU 60, in turn, halts the game and displays the error on the  
22 game as a "tilt." The "tilt" condition renders the slot machine unplayable until the  
23 error condition is addressed by service personnel.

24 As stated above, while the reel is spinning, the local microcontroller 50  
25 performs a low-level iterative task independent from the CPU 60. This iterative task  
26 is controlled by a reel driver state machine and a reel driver time interval variable.  
27 These two pieces of data define what the reel driver should be doing and at what rate.  
28 The time interval variable is used to scale the task execution for a particular reel  
29 driver state. For example, if the CPU 60 commanded the local microcontroller 50 to  
30 spin the reel at a constant speed of 4 milliseconds per step, the reel driver state would  
31 be "spin" and the time interval variable would be 4 milliseconds. The local  
32 microcontroller 50 would still execute the iterative task every 1 millisecond, but  
33 would only execute the "spin" state of the task every 4 milliseconds. The reel driver

state machine is changed by the high-level commands (e.g., start spin, stop, etc.) of the CPU 60 and by the local microcontroller's own logic.

Examples of reel driver states include:

- Single Tab Idle: If the encoder wheel is of the single-tab type, this operation does nothing.
- Multi-Tab Idle: If the encoder wheel is of the multi-tab type, the local microcontroller 50 monitors the optical detector 48 via the detector interface 56 every 10 milliseconds, verifying that the reel has not moved from a notch. This state has a duration of about 20 microseconds.
- Acceleration: The local microcontroller 50 begins moving the reel from rest to the spin speed via the acceleration profile included in the high-level start spin command from the CPU 60. This state has a duration of about 50 microseconds.
- Spin: The local microcontroller 50 moves the reel at the commanded spin speed. This state has a duration of about 30 microseconds.
- Find Home: The local microcontroller 50 moves the reel at the commanded spin speed and begins looking for the home position defined by the encoder wheel. If the optical detector 48 does not detect the home position, the local microcontroller 50 sets an error flag. With respect to a multi-tab encoder wheel, the local microcontroller 50 also sets an error flag if the encoder wheel is stuck on a tab or notch at the optical detector 48. This state has a duration ranging from about 60 to 150 microseconds.
- Deceleration Wait: If the home position is found, the local microcontroller 50 moves the reel at the commanded spin speed until deceleration needs to begin. For multi-tab encoder wheels, the local microcontroller 50 flags an error if the encoder wheel is stuck at either a tab or notch at the optical detector 48. This state has a duration ranging from about 70 to 140 microseconds.
- Deceleration: The local microcontroller 50 begins decelerating the reel from the commanded spin speed via the deceleration profile included in the high-level stop command from the CPU 60 until the reel comes to rest. For multi-tab encoder wheels, the local microcontroller 50 flags an error if

the encoder wheel is stuck at either a tab or notch at the optical detector 48. This state has a duration ranging from about 50 to 130 microseconds.

- Final: After the reel has decelerated and stopped, the local microcontroller 50 prepares to go to either the Single Tab Idle state or the Multi-Tab Idle state, depending upon the design of the encoder wheel. This state has a duration of about 60 microseconds.

In one embodiment, each reel mechanism includes the components illustrated in FIGS. 2 and 3. Each reel mechanism includes a respective reel and an associated reel driver 38, including a local microcontroller 50. Therefore, the three-reel slot machine includes three reel mechanisms with the respective reels 12, 14, and 16 and three respective reel drivers 38. Alternatively, a single reel driver 38, including a single local microcontroller 50, could be used to drive all three of the reels 12, 14, and 16. Each reel, however, would still require its own encoder wheel and optical detector.

The simple, low-cost local microcontroller 50 is advantageous in that it assumes the low-level reel driver operations previously performed by the CPU of prior art slot machines. Because the local microcontroller 50 performs the low-level reel driver operations, the CPU 60 is free to provide better performance for other tasks. The CPU 60 can process data quicker and increase the speed of the overall game. Examples of suitable local microcontrollers 50 for the present invention are Cypress Universal Serial Bus microcontrollers manufactured by Cypress Semiconductor Corp., C541U Family Multipurpose Microcontroller with On-Chip USB Module manufactured by Siemens AG, and certain microcontrollers from ST Microelectronics.

In addition, the local microcontroller 50 allows for the use of the serial link 62 between the reel driver 38 and the CPU 60. The serial link 62 is in the form of a single cable, which is advantageous because it replaces the more costly and complex bundle of wires found between the reel mechanism and CPU of prior art slot machines. The serial link 62 reduces the cost to manufacture the slot machine, improves the reliability of the slot machine, and facilitates future modifications to the reel driver 38.

While the present invention has been described with reference to one or more particular embodiments, those skilled in the art will recognize that many changes may

1 be made thereto without departing from the spirit and scope of the present invention.  
2 Each of these embodiments and obvious variations thereof is contemplated as falling  
3 within the spirit and scope of the claimed invention, which is set forth in the  
4 following claims.

**WHAT IS CLAIMED IS:**

1. A slot machine, comprising:
  - a central processing unit for operating the slot machine in response to a wager;
  - and
  - a reel mechanism including a motor, a symbol-bearing reel, and a reel driver, said motor including a rotatable shaft, said reel being mounted to said shaft, said reel driver including a local microcontroller distinct from and coupled to said central processing unit, said reel driver being coupled to said motor to cause said motor to rotate said reel, said local microcontroller performing low-level reel driver operations independent from said central processing unit.
2. The slot machine of claim 1, wherein in response to actuation by a player, said reel is rotated and stopped to place the symbols of said reel in visual association with one or more pay lines.
3. The slot machine of claim 1, wherein said low-level reel driver operations include monitoring said reel and at least partially controlling its position.
4. The slot machine of claim 3, wherein said local microcontroller monitors said reel by sampling its state multiple times per second in real time, and responds with control commands for controlling the position of said reel.
5. The slot machine of claim 1, wherein said local microcontroller is serially connected to said central processing unit.
6. The slot machine of claim 1, wherein said reel driver includes a printed circuit board proximate said reel, said microcontroller being mounted to said printed circuit board.
7. The slot machine of claim 1, wherein said central processing unit issues high-level commands to said local microcontroller, said high-level commands including a

1 start spin command for spinning said reel and a stop command for stopping said reel  
2 at a specified stop position.

3  
4 8. The slot machine of claim 1, wherein said reel includes an encoder for  
5 indicating the position of said reel, and wherein said reel driver includes an optical  
6 detector for reading said encoder, said local microcontroller being coupled to said  
7 optical detector to monitor the position of said reel.

8  
9 9. A slot machine, comprising:  
10 a motor including a rotatable shaft;  
11 a symbol-bearing reel mounted to said shaft;  
12 a reel driver including a local microcontroller serially linked to said central  
13 processing unit, said reel driver being coupled to said motor to cause  
14 said motor to rotate said reel, said local microcontroller performing  
15 low-level reel driver operations related to rotation of said reel; and  
16 a central processing unit issuing high-level commands to said reel driver  
17 related to the rotation of said reel.

18  
19 10. The slot machine of claim 9, wherein said high-level commands include a start  
20 spin command and a stop command, said start spin command instructing said reel  
21 driver to cause said motor to rotate said reel, said stop command instructing said reel  
22 driver to stop said motor from rotating said reel at a specified stop position

23  
24 11. The slot machine of claim 10, wherein said low-level commands include  
25 sampling a state of said reel in real time and at least partially controlling its position.

26  
27 12. A slot machine, comprising:  
28 a motor including a rotatable shaft;  
29 a symbol-bearing reel mounted to said shaft;  
30  
31 a reel driver including a local microcontroller, said reel driver being coupled  
32 to said motor to cause said motor to rotate said reel; and

1 a central processing unit for issuing a start spin command and a stop command  
2 to said reel driver, said start spin command instructing said reel driver  
3 to cause said motor to rotate said reel, said stop command instructing  
4 said reel driver to stop said motor from rotating said reel at a specified  
5 stop position;

6 said local microcontroller monitoring said reel in real time and at least  
7 partially controlling its position after said start spin command and prior  
8 to said stop command.

9  
10 13. The slot machine of claim 12, wherein said reel includes an encoder for  
11 indicating the position of said reel, and wherein said reel driver includes an optical  
12 detector for reading said encoder, said local microcontroller being coupled to said  
13 optical detector to monitor the position of said reel in real time.

## ABSTRACT

A slot machine comprises a central processing unit (CPU) and a reel mechanism. The CPU operates the slot machine and randomly determines a game outcome in response to a wager. The reel mechanism includes a motor, a symbol-bearing reel, and a reel driver. The motor includes a rotatable shaft, and the reel is mounted to the shaft. The reel driver includes a local microcontroller distinct from and coupled to the CPU. The reel driver is coupled to the motor to cause the motor to rotate the reel. The CPU issues high-level commands to the reel driver related to rotation of the reel. The high-level commands may, for example, include a start spin command for starting rotation of the reel and a stop command for stopping the reel at a specified position. However, to free up the CPU for other tasks, the local microcontroller performs low-level reel driver operations related to the rotation of the reel. The low-level reel driver operations may, for example, include sampling a state of the reel in real time, performing calculations, and responding with control changes.

**RULES 63 AND 67 (37 C.F.R. 1.63 and 1.67)  
DECLARATION AND POWER OF ATTORNEY**

**FOR UTILITY/DESIGN/CIP/PCT NATIONAL APPLICATIONS**

As a below named inventor, I hereby declare that:

My residence, post office address and citizenship are as stated below next to my name;  
and

I believe that I am the original, first and sole inventor (if only one name is listed below) or an original, first and joint inventor (if plural names are listed below) of the subject matter which is claimed and for which a patent is sought on the invention entitled: **Slot Machine Reel Mechanism With Dedicated Local Microcontroller**, the specification of which: (mark only one)

- ☒ (a) is attached hereto.  
— (b) was filed on \_ as Application Serial No. \_ and was amended on \_\_\_\_ (if applicable)  
— (c) was filed as PCT International Application No. PCT/ \_\_\_\_ on \_\_\_\_ and was amended on \_\_\_\_ (if applicable).  
— (d) was filed on \_ as Application Serial No. \_ and was issued a Notice of Allowance on \_\_\_\_.  
— (e) was filed on \_ and bearing attorney docket number \_

I hereby state that I have reviewed and understand the contents of the above identified specification, including the claims as amended by any amendment referred to above or as allowed as indicated above.

I acknowledge the duty to disclose all information known to me to be material to the patentability of this application as defined in 37 CFR § 1.56. If this is a continuation-in-part (CIP) application, insofar as the subject matter of each of the claims of this application is not disclosed in the prior United States application in the manner provided by the first paragraph of 35 U.S.C. § 112, I acknowledge the duty to disclose to the Office all information known to me to be material to patentability of the application as defined in 37 CFR § 1.56 which became available between the filing date of the prior application and the national or PCT international filing date of this application.

I hereby claim foreign priority benefits under 35 U.S.C. § 119/365 of any foreign application(s) for patent or inventor's certificate listed below and have also identified below any foreign application for patent or inventor's certificate filed by me or my assignee disclosing the subject matter claimed in this application and having a filing date (1) before that of the application on which my priority is claimed or, (2) if no priority is claimed, before the filing date of this application:

PRIOR FOREIGN PATENTS

<u>Number</u>	<u>Country</u>	<u>Month/Day/Year</u> <u>Filed</u>	<u>Date first</u> <u>laid-open or</u> <u>Published</u>	<u>Date</u> <u>patented or</u> <u>Granted</u>	<u>Priority Claimed</u> <u>Yes</u>	<u>No</u>
NONE						

I hereby claim the benefit under 35 U.S.C. § 120/365 of any United States application(s) listed below and PCT international applications listed above or below:

PRIOR U.S. OR PCT APPLICATIONS

<u>Application No. (series code/serial no.)</u>	<u>Month/Day/Year Filed</u>	<u>Status(pending, abandoned, patented)</u>
NONE		

I hereby appoint:
